

# MORE CLIENT VALUE. LESS REPETITIVE WORK.

Build on One Page's existing products and services.

## THE OPPORTUNITY

### Automate the preparation. Keep the expert judgment.

Plan Builder. Monthly reviews. Consultant expertise.  
Established customer relationships.

Concept illustration

#### 01 / MONTHLY REVIEW

### A meeting-ready review packet.

Existing service: consultant-led monthly  
reviews [01]

Plan + KPI updates

Check + draft

Consultant approves

Validate KPI updates; AI drafts the review brief and agenda. After approval, meeting decisions become assigned actions.

**Measure: preparation + follow-up minutes per review.**

#### 02 / PLAN BUILDER

### A stronger plan. Fewer revisions.

Existing product: Classic, Non-Profit,  
Recruiting [02]

Approved examples

Guided interview

Customer accepts

AI interviews customers using the selected edition and approved examples. Draft five sections; flag missing measures and unresolved decisions.

**Measure: time to accepted plan + revision minutes.**

#### 03 / EXISTING CUSTOMERS

### The right next One Page service.

Existing assets: account relationships + guide  
capture [03]

Eligible records

Assess + match

Owner approves

Match stated needs to Plan Builder, consultant review or enterprise service. AI prepares personalized follow-up for the consultant.

**Measure: qualified meetings + paid reactivations.**

## IMPLEMENT IN THE EXISTING ENVIRONMENT

### Microsoft

Power Automate + SharePoint

### Google

Workspace Studio + Apps Script

### Mixed stack

Make or n8n + approved AI

Begin with approved files and forms. Add direct integrations only where access is confirmed.

## START WITH ONE MONTHLY REVIEW WORKFLOW

Baseline effort. Test draft outputs. Expand on measured results.

# Make every monthly review easier to deliver.

Recommendation: automate preparation and follow-through around One Page's existing consultant-led review service. Preserve the consultant's judgment and client relationship. [01]

**WHAT ONE PAGE RECEIVES**  
A client-specific review packet: performance changes, missing inputs, overdue commitments, decisions requested, proposed agenda and an approved action register.

**THE PROPOSED WORKFLOW**

|          |                                        |                                                                                                                                                                                        |
|----------|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>1</b> | <b>Open the review cycle</b>           | On an agreed schedule before the meeting, create a client-period record and request the plan, KPI update and prior actions. Use a structured intake when an export is unavailable.     |
| <b>2</b> | <b>Check the evidence</b>              | Validate the reporting period, units, targets and metric definitions. Calculate variances with rules or code. Missing information becomes a flagged question, never an invented value. |
| <b>3</b> | <b>Draft the review packet</b>         | AI explains changes using only approved inputs. Each observation links to its source and plan objective. Separate known facts, hypotheses and questions for the meeting.               |
| <b>4</b> | <b>Consultant reviews and releases</b> | The consultant edits interpretation and priorities, then approves the exact packet. Retain its input snapshot and approval record. Unresolved data stays visibly unresolved.           |
| <b>5</b> | <b>Close the loop</b>                  | From authorized meeting notes, draft decisions, owners and dates. After approval, create tasks in the chosen task system and carry outstanding items into the next review.             |

**WORK REMOVED**

Repeated document gathering, status chasing, packet assembly and retyping meeting follow-up. Confirm today's manual effort before estimating capacity.

**FIRST DELIVERY / OWNER**

One consultant and a small, permissioned client sample. Operations owns the workflow; the consultant owns content release. Deliver the packet, action register and exception queue.

**ACCEPTANCE + BUSINESS VALUE**  
Every reported KPI has a source and period; every released action has an owner and due date; retries create no duplicate tasks. Compare preparation, review, corrections and follow-up minutes with the baseline. Lower delivery effort can support more reviews per consultant; any paid expansion must be measured.

# Put One Page's expertise to work at scale.

Existing foundations: Plan Builder templates, examples and three editions; consultant resources; training and certification responsibilities. The proposed assistants use content approved by One Page. [02,05,06]

## 02 / A METHODOLOGY-GROUNDED PLAN BUILDER COACH

### Launch a guided companion using existing Plan Builder exports.

- |                                         |                                                                                                                                                                                                     |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>1 Start from the customer's plan</b> | Choose Classic Business, Non-Profit or Recruiting Department. Accept interview answers or an authorized Word/PDF export of an existing plan. Ask only the follow-up questions needed.               |
| <b>2 Apply the actual method</b>        | Retrieve versioned examples and structure Vision, Mission, Objectives, Strategies and Action Plans. Keep One Page's concise language. Do not invent targets, market facts or financial projections. |
| <b>3 Check, revise and accept</b>       | Use an expert-approved clarity checklist: measurable objective, time horizon, accountable owner, KPI definition and linked action. Show suggested changes; the customer accepts the final wording.  |

#### DELIVERABLE

An editable plan, highlighted suggested changes, unresolved decisions and a relevant tutorial or consultant handoff. Start with Word/PDF output; native import is unverified.

#### MEASURE / COMMERCIAL VALUE

Time to accepted plan; consultant revision minutes; plan completion; paid continuation. Evaluate an assisted-plan upgrade only after usage and delivery costs are known.

## 04 / CONSULTANT READINESS, RESOURCES + CLIENT PREPARATION

### A permissioned workbench for the consultant network One Page already operates.

#### WHEN A CONSULTANT NEEDS HELP

A question or accepted engagement triggers retrieval from current approved resources. Return the relevant excerpt, source/version and next step; assemble the assessment and client kickoff brief.

#### WHEN A CONSULTANT JOINS

Create the training checklist, schedule reminders, prepare cohort materials and flag incomplete milestones. The training lead decides competence and certification; operations approves client assignment.

#### DELIVERABLE + PROOF

Deliver a cited resource assistant, consultant launch pack and readiness queue. Measure time to find an approved answer, preparation minutes per engagement, onboarding administration and time to first client engagement. Client-private material remains isolated from shared methodology content.

# Make the next customer interaction useful.

Start with records One Page can actually access and use. Its KPI-guide form already distinguishes existing system users, and Plan Builder offers a route to enterprise service. [02,03]

## 03 / EXISTING-CUSTOMER PLAN REFRESH + OFFER ROUTING

- |          |                                      |                                                                                                                                                                                                       |
|----------|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>1</b> | <b>Create a usable account queue</b> | Deduplicate authorized records; preserve customer status, product, last confirmed engagement, assigned consultant and contact permission. Exclude unknown permissions until reviewed.                 |
| <b>2</b> | <b>Ask what changed</b>              | After the account owner approves the audience and invitation, ask eligible customers what changed, which priority is stuck and what help is wanted. Use their answers, not AI guesses.                |
| <b>3</b> | <b>Match an existing service</b>     | Use approved rules: self-guided plan need → Plan Builder; execution/accountability need → consultant review; multi-manager alignment need → enterprise discussion. Consultant confirms fit and terms. |
| <b>4</b> | <b>Prepare and route follow-up</b>   | AI drafts from verified history and approved offers. The account owner approves the audience and message. Use the existing marketing system; stop sequences on reply, purchase or opt-out.            |

### DELIVERABLE

A consultant queue with the customer's stated need, suggested service, relationship owner, next action and follow-up status. Preserve attribution to the originating consultant.

### MEASURE / COMMERCIAL VALUE

Eligible accounts → replies → qualified meetings → paid reactivations or upgrades. Track staff minutes per qualified meeting and contribution after incremental delivery costs.

## 05 / PLAN BUILDER ONBOARDING + SERVICE TRIAGE

### Guide new customers from purchase to a completed first plan.

A purchase confirmation or service request starts the flow. Confirm the account and edition; deliver existing assessment/tutorial materials; request a progress check; classify setup, usage, billing or upgrade questions; draft an approved-source answer or assign an owner. Use customer responses until product-usage events are available.

### CONTROL + PROOF

Staff approve refunds, cancellations, access changes and unresolved cases. Never generate or expose credentials through AI. Measure time to first plan, support minutes per resolved request and repeat contacts. Reconcile public policy wording with the authoritative internal policy before automating answers.

# Connect the work to systems already in use.

Begin with a small approved input set. The first release can operate through files, forms and reviewed outputs; a proprietary One Page API is not a prerequisite.

## 06 / KPI COLLECTION, RECONCILIATION + EXCEPTION ROUTING

### Extend the existing Planning and Performance System; do not duplicate its dashboards or cascading-plan capability. [04]

At the reporting cutoff, ingest approved source exports or accessible connectors for selected KPIs. Map each value to a stable objective, owner, period, unit and definition. Calculate actual-versus-target; flag stale data, missed targets and missing ownership. A metric owner resolves exceptions before publication. Deliver a reconciled update file and an exception-only leadership digest.

**Measure:** data-entry and reconciliation minutes, reporting lag, update completeness and corrected figures. Start read-only; use a supported import/write route only after the vendor and customer approve it.

## CHOOSE ONE PRIMARY AUTOMATION ROUTE

|               |                                                                                                                                                                                                                                                                                      |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MICROSOFT     | Power Automate → SharePoint / Lists → validation → AI Builder prompt → approval → reviewed output / task.<br><br>Use Teams/Outlook for approval notices. Planner connector covers basic plans. Confirm AI capacity, connector entitlements and tenant setup. [07-09]                 |
| GOOGLE        | Forms / Drive / Sheets → Apps Script validation → Workspace Studio AI draft → controlled reviewer queue → Docs / task handoff.<br><br>Use a restricted approval record and named approver. Verify Studio access and Apps Script quotas; assign durable trigger ownership. [10,11,14] |
| MIXED SYSTEMS | Make or n8n → authenticated connector / file intake → validation → approved AI service → review → destination.<br><br>Choose by existing tools and operating support. Add retry limits, deduplication, an error queue and a named maintainer. [12,13]                                |

## ONE SHARED OPERATING RECORD

**Client → plan → objective → KPI → action → reporting period → source → approval.**

Use stable IDs and source snapshots. Run calculations outside the language model. Keep approval separate from AI text; bind it to the exact output. Enforce client permissions before retrieval and prevent duplicate sends or tasks on retry.

# Prove productivity. Then expand what works.

A proposed 30/60/90-day sequence after access, owners and scope are agreed. These are delivery checkpoints, not promised performance results.

## DAYS 1-30

### Produce the first review workflow

Name the operations sponsor and consultant reviewer. Inventory existing automation. Time the current review process, replay approved historical inputs, then run draft packets alongside live work. Deliver the packet, action register and exception queue.

## DAYS 31-60

### Reuse the method and customer record

If review quality and effort improve, reuse the plan schema for the Plan Builder coach. Approve the content library and clarity checklist. Build the permissioned customer-refresh queue and test one approved offer per segment.

## DAYS 61-90

### Extend capacity deliberately

Add selected KPI feeds, consultant preparation and onboarding workflows where baseline volume justifies them. Assign ongoing ownership, train users, document recovery steps and decide which capabilities belong in the product.

## SCALE / REVISE DECISION

Agree the required improvement before launch. Scale when measured effort falls materially, quality holds, approvals are traceable and sustained use justifies recurring cost. Revise when correction or exception work erases the benefit; stop any route that cannot preserve client permissions.

### MEASURE NET CAPACITY, NOT JUST AI SPEED

Net hours recovered = completed runs × (baseline minutes – total new human minutes) ÷ 60 – maintenance hours. Include review, corrections, exceptions and follow-up. Record software/AI cost separately. Recovered time becomes cash savings only when a real expense is removed or avoided.

## PRIMARY SOURCES / VERIFIED 26 SEPTEMBER 2026

[01] One Page: performance management

[02] One Page: Plan Builder

[03] One Page: KPI guide / existing-user field

[04] One Page: enterprise / cascading plans

[05] One Page: operations / certification

[06] One Page: books and licensed resources

[07] Microsoft: Power Automate approvals

[08] Microsoft: AI prompts in flows

[09] Microsoft: Planner connector

[10] Google: Workspace Studio

[11] Google: Apps Script triggers / ownership

[12] n8n: AI tool approval

[13] Make: webhook orchestration

[14] Google: Apps Script quotas

Evidence boundary: current products and public journeys are verified; private workload, stack, permissions, exports beyond Plan Builder and financial baselines are unknown. The workflows are proposed implementations. Do not infer that existing processes are currently manual.
